Why to attend ESH 2018?

To deepen the utility of a CDT called TeenBP

One of the main problems of hypertension is the lack of awareness and in those who have been already diagnosed the lack of control. Electronic Health Recordings (EHR) can help not only in the control but also in the diagnosis of chronic diseases by means of the integration of Clinical Decision Tools (CDT). Hypertension, which was previously low frequent in pediatric age in now becoming a common problem due to the obesity epidemic in children.

Introduction of CDTs in EHR and in App, such is the released by the ESH, can help to improve hypertension management and the rate of control in all groups of age.
